

ABSTRACT

An electrical apparatus operation control state system includes communication control means (13, 25, 30, 73) disposed between the electrical apparatus (1, 29, 53) and an operating power supply for the electrical apparatus (1, 29, 53), and operation state switching means (6R, 40, 43, 55, 67R) disposed at the electrical apparatus (1, 29, 53) side for switching an operation state of the electrical apparatus (1, 29, 53) independent of operation in the operation means (4, 6M, 42, 54, 67M). The operation state switching means (6R, 40, 43, 55, 67R) is rendered operable via the communication control means when a remote operated terminal (14, 23) executing an over-the-horizon communication with the communication control means.
